EPIDEMIOLOGY

SOURCE OF EVENT OR ORIGIN OF INFECTION

- Illegal movement of animals
- Introduction of new live animals
- Vectors

EPIDEMIOLOGICAL COMMENTS

On 29 March 2021, District livestock officer (DLO) was notified by a farmer on severe skin disease and abscesses in a beef cattle farm. The clinical appearance in some of the animals included several skin nodules (2-5 cm in diameter), high fever, inappetite and lymph node enlargement. The initial diagnosis after the clinical examination was bacterial infection and external parasite. However, after treatment with antibiotics and ivermectin for approximately one week, the clinical signs did not improve, and the skin nodules started to develop to severe ulcer. Therefore, DLO immediately notified the Provincial Livestock officer for further sample collection according to the lumpy skin disease clinical surveillance guideline provided by the Department of Livestock Development (DLD) earlier. The collected samples were whole blood in EDTA, scab and skin lesions, which were submitted to the National Institute of Animal Health for confirmation. The control measures were movement restriction of animals in the affected provinces, including public awareness especially on disease definition to support active clinical surveillance and early detection, distribution of insecticides and insect repellents, and establishment of the containment zone within 50 km radius. The target vaccination will be immediately implemented in a target area after the importation of the Lumpy skin disease vaccine when it is approved by the Thai Food and Drug Administration (FDA). The vaccine was approved by the Thai Food and Drug Administration (FDA) and the first lot of vaccines arrived at Thailand on the 29 May. The vaccine plan was initiated and will take action as soon as possible. The first lot of vaccines plan was operated and every adverse reaction after receiving vaccine was observed and reported to Department of Livestock

Development.
